

Hackathon Project 2: Intelligent Next Best Action Platform

Objective

Design and build a reusable **Agentic Decision Intelligence Platform** that transforms customer interactions and enterprise knowledge into actionable recommendations. The platform should intelligently determine the next best actions by combining contextual understanding, organizational knowledge, and business reasoning.

The focus of this hackathon is **building a reusable agentic platform**, not simply a chatbot or RAG application. We are looking for teams that can design intelligent, explainable, and extensible AI systems capable of assisting business users in making better decisions.

Business Challenge

Choose any **B2B business domain** (e.g., SaaS Sales, Staffing, Energy, Customer Success, etc.) and define:

- Business process
- Customer journey
- Decision points
- Success metrics

Your platform should use a **Planner Agent** to dynamically orchestrate specialized agents and complete the following end-to-end workflow:

1. Ingest customer interactions such as meeting notes, transcripts, CRM updates, emails, or conversations.
 2. Gather relevant organizational context from enterprise knowledge sources, including knowledge articles, playbooks, best practices, product documentation, CRM data, and customer history.
 3. Analyze the business context and identify opportunities, risks, and missing information.
 4. Recommend the most appropriate next best actions for the user.
 5. Explain the reasoning behind each recommendation with supporting evidence and confidence.
 6. Support **Human-in-the-Loop** review before recommendations are accepted or executed.
 7. Learn from previous interactions using memory to continuously improve future recommendations.
-

Platform Expectations

Your solution should be designed as a reusable platform with capabilities such as:

- Dynamic planner-based agent orchestration
- Reusable agent and tool architecture
- Shared memory for customer interactions and organizational context

- Retrieval and reasoning across multiple enterprise knowledge sources
 - Explainable recommendations with supporting evidence
 - Configurable workflows and business rules
 - Extensible framework for adding new agents and business use cases
 - Intuitive user experience for interacting with the platform
-

Deliverables

- **5-minute Demo Video** showcasing the platform and business use case
 - **5-minute Architecture Walkthrough** explaining key design decisions
 - **GitHub Repository** with source code, documentation, and setup instructions
-

Evaluation Criteria

Platform (70%)

- Quality of Agentic AI architecture
- Reusability and extensibility
- Memory and orchestration design
- User experience
- Creativity and innovation

Business Use Case (30%)

- Understanding of the chosen business domain
 - Effectiveness of business reasoning and recommendations
 - Quality and relevance of next best actions
 - Evaluation methodology and measurable business outcomes
-

Freedom to Innovate

This challenge intentionally defines the **problem**, not the **solution**. Teams are free to choose their own technology stack, AI models, orchestration frameworks, databases, retrieval strategy, user interface, deployment approach, and implementation methodology. We encourage experimentation, thoughtful engineering decisions, explainable AI, and creative approaches to building intelligent decision-making platforms.
